

Getting more from your geoscientific images with Imago

DEMO GUIDE

Imago is a cloud-based platform to easily access, collaborate and validate using your high-quality geoscientific images. Imago integrates with Seequent's ecosystem and connects seamlessly with Leapfrog, Oasis montaj, Target and MX Deposit, making accessibility and management of images much easier for customers across all stages of the mining value chain.

Imago comprises three capabilities Capture, Catalogue, and Connect, that combine to form a complete geological imagery management solution.

The best way to get a feel for Imago is to try the software through the free, no-obligation demo. It's easy to do; sign into the Imago Portal demo account and explore the Imago web viewing tools.

WHEN YOU'RE READY

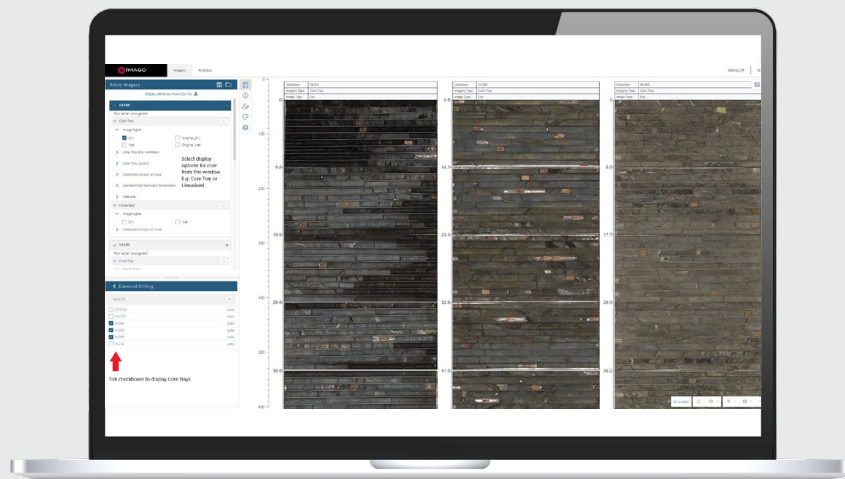

CLICK TO START

QUICK START

Once signed in, you will see a navigation pane on the left. Tick one or more checkboxes to display drill core imagery. You can display it in the core tray or as a linearised downhole by scrolling through the navigation pane and choosing your preferred settings.

You can view the core as Wet or Dry and at different depths, and compare drill core from different locations by viewing multiple drill holes next to each other.

Click and drag to pan, and roll your mouse wheel to zoom – just like Google Maps.

Find out more about our Data Management solutions and how they can support you in making more informed decisions across the mining value chain.
